

The Lancaster, Pennsylvania Facility is now substantially complete and we have commenced with startup. The facility will process approximately 170,000 TPY of fresh ash from two county owned facilities. The project was delivered by Inashco using a design, build, own and operate model. The public private partnership contract has a 20 year term. This is the first Inashco facility to incorporate the ballistic coarse separator (BCS) which is installed upstream of the ADR and allows us to process combined (bottom and fly ash) fresh ash transported directly from the county facilities.
